

ear of its existence than have been tried during the previous years of their manufacture. Although they hooted at the idea of new beginners, as they styled us, teaching them anything, still they are trying hard, as we learn, to imitate some of our last year's improvements.

In the meanwhile, we have not been idle, but have improved the machine greatly in many important features. We have improved the finger-beam, the sickle, and the fingers. We have put on new and greatly-improved dividers, both inside and outside. We have put on a better and more convenient binders' stand and tables, and made a more handy connection of it to the frame of the machine. But the crowning feature of all is our new reel. This we have arranged so that it can be placed in any desired position by the driver while in his seat by means of a lever within easy reach, and just as easy to handle as the tilting lever. It can be placed forward and down, or back over the fingers and down, or it can be placed up and in the proper position for tall, straight grain, or in any position that may be required by the character of the cutting to be done, and this can all be done without the driver leaving his seat or stopping the horses for a moment.

We are certain that no Harvester in the market can show this year so many desirable features as the one we shall present to the consideration of our friends.

The improvements were tested in the field last harvest, and we know that the machine as now constructed will cut any grain that can be cut by machinery.

We are also arranging the Harvester this year so that at any time hereafter our new Automatic Binder
