

IMPROVED SUPERIOR FERTILIZER DRILL NO. 3.

The Superior Standard Plain Drill

Has our Celebrated Adjustable Single Force Feed Distributer, driven by side gear wheels, which are on the drill at all times. The Distributer is readily adjustable and is a true force feed. The quantity of grain and grass seed to be sown per acre is governed by an indicator lever and dial plate on the rear of the hopper.

All Superior Drills have Land Measures, which accurately indicate the amount of ground traversed by the drill. All drills also have the Superior Hoe Shifting Device for staggering the hoes.

The Superior Fertilizer Drill No. 2.

This drill is supplied with the Adjustable Single Force Feed Distributers for sowing grain and grass seed, which are driven and regulated in the same convenient and successful manner as in our Standard Plain Drill. The No. 2 Fertilizer Drill has on its revolving steel axle a Disk Wheel Attachment for driving the Fertilizer Distributers and regulating the quantity sown. The Disk Wheel Fertilizer Attachment enables the user to sow the fertilizer or refrain from doing so in fields of varying fertility, the change being accomplished in a second of time by dropping or raising a lever.

The well-tested and universally satisfactory Marks Feed Fertilizer Attachment is used on all Superior Fertilizer Drills, which insures the fertilizing material being fed in an even, continuous stream from each distributer, without clogging or pasting. The substance lies quiet upon the revolving bottom-plate, and is not stirred or worked except at the instant of discharge, when it is immediately dropped out in the exact quantity the drill is set to sow.
