PATENT STEEL BEAM CENTER DRAFT PLOW.

We invite the closest scrutiny to the following facts:—

It is absolutely Center Draft and the only Perfect Center Draft Plow ever made. The rear of the Steel Beam is substantially bolted to the solid *Steel* Frame or Frog, at an equi-distant space between the landside and share, so the point of draft starts at the exact center of resistance and as the Beam curves over the Plow and extends in a direct line to the point of attaching the power the draft is direct from the center of resistance.

It draws lighter, owing to the Center Draft. The pressure of soil is equally distributed on either side of the Beam, and the natural friction is proportioned evenly to all parts subject to pressure. The Landside being relieved of one-fourth of the side friction, this resistance, common to other Plows, is relatively reduced. They are made left and right hand; single and double shin; 10, 12, 14 and 16 inch cut.
