SIDE VIEW.

THIS CULTIVATOR is the result of years of experimenting, and we now offer to the trade a machine having all the good points of former styles, and many new and important features never before shown on this style of cultivator. The running depth of the shovels is regulated by **LOCK-DOWN LEVERS**, and the gangs are raised automatically by the application of a new and novel spring device. We have entirely overcome the hard labor of pushing or pulling the levers. It only requires the thumb and finger to release the dog from the ratchet, and the spring will then do the work. This valuable feature is admired **AT ONCE** by **ALL** who see the machine. The **PIVOT AXLES** are operated by foot levers conveniently arranged. A **SPREADING LEVER** is used to throw the gangs to or from the row, as occasion may require.

IMPORTANT—Each machine is provided with a locking attachment, by which it can easily and instantly be changed to or from a rigid axle machine. This can be done without stopping the team or leaving the seat.

Furnished with either Plain, Parallel, Eagle-claw (8 shovel), or Spring-tooth Gangs, and with or without center attachments. It also has an adjustable **TRUSS** which prevents the wheels from sprawling at the bottom, thus overcoming a common defect in all pivot axle cultivators.

NEW FREMONT

Our Latest Success in Riding Cultivators.

Not an experiment but a proved success. Hundreds sold in 1904, yet our orders for 1905 are many times greater than last season. This is because the machine is built to meet up-to-date demands.

It combines all the good points of former machines with many new ones added. The gang construction allows no lost motion, and the least forward motion with the foot makes the gangs respond. GANGS and LEVERS are pivoted at same point, always giving a vertical position to the shovels and a vertical pressure on gangs.

LOCK-DOWN LEVERS control the running depth of the shovels and the levers do not require pulling and pushing to raise the gangs. Simply use the thumb and finger to release the dog from the ratchet, and the spring will lift the gangs free from the ground. This feature is admired at once by all who have occasion to handle the machine.

GANG CONNECTOR is simple, but strong, made of 2 flat steel bars and an adjustable latch in easy reach of the operator. By raising the latch the gangs can be removed easily and instantly to any desired distance apart, or by slipping a small loop over the latch the gangs can be guided independently of each other.

Wheels 44 in. high, adjustable on spindles for different widths of rows.

Made with either hammock seat or straddle seat. Either style of seat is readily adjusted to the size of the rider and can be changed or removed instantly.

FRAME is kept in perfect balance by a hand lever.

We furnish this machine in the following styles of gangs:

6 shovel, Pin break or Spring break,

8 shovel, Pin break (Eagle Claw)

Or with 10 Spring Teeth.

Center Attachments can be used if desired. The machine is fully and easily adjustable in all its parts. Here are a few of the most important adjustments: Gangs, seat, singletrees, balance of frame, pitch of shovels, gang pressure, foot levers, shields and wheels. In short, we are confident you will be agreeably surprised to see how perfect it is. The machine must be seen to be fully appreciated.

Fully guaranteed in workmanship and material.
