The Childs All Steel Spring Tooth Lever Harrow.

IN THE CONSTRUCTION OF THE CHILDS LEVER HARROW, the same general form of frame which has been found most desirable after years of experience for **Spring Tooth Harrows**, is retained, the Teeth being placed in zig-zag positions. This feature of **great superiority** over Lever Harrows with the style of frame having rolling bars, or where the teeth are placed on parallel lines, will be much appreciated. In the **Childs Harrow** the teeth are not perforated and bolted to the frame, but are securely held by means of malleable holders extending below the frame, (without any bolt heads exposed to wear,) which at the same time act as shoes and keep the frame properly elevated, even in soft, loamy soil, and the teeth having abundant clearance, **absolutely prevents clogging.**

The teeth are adjustable in the holders, so that the points can be set perfectly uniform, which cannot be done on harrows where the teeth are perforated and bolted stationery to the frame, there always being more or less variation in forming the teeth; and besides this advantage, the teeth on the **Childs Harrow** can be adjusted in the holders, as they wear. By means of the levers all the teeth can be adjusted instantly as to the depth of cut. The **Childs Harrow** is made of the **best open-hearth Steel** throughout. The teeth are oil tempered. The construction of the frame, teeth holders and lever connections is such that the harrow is very strong, and it works perfectly in every particular. The **Childs Lever Harrow** is the greatest success ever produced in the line of Spring Tooth Harrows.
