## STRAIT'S

### All Steel Frame Adjustable Spring Tooth HARROW.

---

In offering this Harrow to the trade, we would briefly state that it has been our aim to give to the trade the very best Harrow made for the least possible money, and to do so, we have deemed it important to control and operate our Harrow business outside of any combination as is our right so decided by Judge Smith of the Supreme Court.

In the first place our Harrow is a plain, well-made spring tooth Harrow, made of the best material that money will buy. Made with 14, 16, 18 and 20 teeth, and made to fold entirely together. Warranted to float even.

The teeth are adjusted on an entirely new principle, which is conceded by every one not to infringe any patent in view of the expired Garver patent.

When the teeth are adjusted from one place to another they are all brought to a uniform depth without measuring, a point not found in other harrows. Is constructed in such a manner as not to be liable to get out of order. In case of accident it should

and can be repaired by any one without taking to a shop. Every part is bolted and not riveted. One bolt holds the tooth and frame at each intersection. It has less number of parts than any harrow made, consequently is less liable to get out of order.

Don't be intimidated by any man's talk regarding infringement or trouble for selling or using this Harrow. We agree to stand between harm and the seller or user.

Respectfully yours,  
CLIPPER CHILLED PLOW Co.,  
Elmira, N. Y.

## STRAIT'S

### Steel Frame Spring Tooth Cultivator.

---

One principle feature being that the shovel can be used without removing the teeth and by setting the tooth a little lower than the shovels. The ground between the rows is left loose and in much better condition than when only the shovel is used; a point not found in other Cultivators and is full of merit. When the Cultivator is changed in its width of cut, the teeth can be changed laterally so they will cut in the

line of draft. This new feature overcomes many defects in other Cultivators. In comparison to other Cultivators, it is precisely the same, as a Spring Tooth Harrow is compared to an old Spike Tooth Harrow. One half more work can be done with the same effort with a Spring Tooth than can be done with a ridged tooth in either a Cultivator or Harrow. Too much of a benefit to be ignored.

The Shovels are made interchangeable and can be used to ridge as well as to hill. Can be adjusted from 30 inches in to 10 inches. Handles adjustable up and down to accommodate boy or man. Made of the very best material and in workman-like manner.

Don't take any man's word that is unfavorable regarding this tool, but go to our nearest agent, or write to the Clipper Chilled Plow Co., and get one. It will do twice as much work as an ordinary Cultivator.
