Iowa City, Iowa 52240

Tom & Carl:

Enclosed is my Spring 1985 field reports. Sorry if they are a little late. I tried to get them out faster but too many things came up as usual. I have not had the slides of the Curlew Sandpiper made into prints yet but should have them before too long. I will send them as soon as I get them. Hopefully the summer and fall will be more exciting than this spring has been. I know I have included more in my report than you need but do not seem to know when to stop and limit my reports. Hope to see you when a good bird shows up this summer or fall. If you need anything else let me know.

Season: SPRING Year: 1985Name and address Francis L. Moore

✓ Kentucky Warbler	1	5-05-85	Near George Wyth SP, Black Hawk Co.

Notes: Western Sandpiper

3 seen on 10 May 1985

at Cedar Lake, Nashua

Three small sandpipers were feeding in deeper water than the similar Semipalmated Sandpipers nearby. They also submerged their heads completely as they fed, unlike the Semipalmated's. The three birds had black legs like the Semipalmated's but the scapulars and upper wing coverts were a rusty reddish color. These three birds also had quite a bit of dark streaking on the sides of the breast toward the center of the breast, but not as dense on the center of the breast as on the sides and not as evident a dividing line on the breast as a Pectoral Sandpiper would show. I could not tell if the bill was longer or more drooped at the tip than the Semipalmated Sandpipers nearby; they looked the same to me.
