Road Maintenance Garages Built by W P A

This is a front view of the road maintenance garage sponsored by the Hamilton county board of supervisors and built by WPA at Williams, Iowa, and duplicated at Stanhope. Each is of steel, concrete and tile construction, with a foundation size approximately 31x90 feet. Both were started last winter and completed this spring. Eleven men were employed during erection of each by the Works Progress Administration.

County road construction and repair, snow removal and secondary road maintenance in general requires machinery and supplies at strategic points for regular and emergency uses. These must be properly housed, and Hamilton county now has two such fine new garages in which to protect its road maintenance equipment, both built by WPA.

The reflooring of hundreds of bridges in most every county in the state has required the employment of many workmen throughout the summer on this important phase of WPA farm-to-market road building projects which aggregate 4,254 miles of construction and improvement.

The rural sanitation program has required the building of almost one thousand sanitary toilets throughout the state as a decided forward step in rural betterment.

These WPA improvements are typical of several thousand state projects planned to create needed employment and made possible through the co-operation of town, city and county officials with the Works Progress Administration.
